Global IUCN Red List Category —

Criteria —

Actitis hypoleucos is a widespread breeder across most of Europe, which accounts for less than half of its global breeding range. Its European breeding population is large (>720,000 pairs), and was stable between 1970–1990. Although many European populations, including key ones in Russia and Norway, were stable or increased during 1990–2000, the species suffered widespread declines—most notably in Sweden and Finland—and underwent a moderate decline (>10%) overall. Consequently, this previously Secure species is now provisionally evaluated as Declining.
