Hydrobates pelagicus breeds almost exclusively within Europe, nesting on offshore islands in the north-east Atlantic and western Mediterranean. Its European breeding population is large (>430,000 pairs), and was stable during 1970–1990. Although the species declined in Spain and the Canary Islands during 1990–2000, most European populations were stable, and the species remained stable overall. As a consequence of an improved knowledge of its distribution and numbers, this previously Localised species is now provisionally evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag.%	References
Croatia	(1 – 10)	02	?	–	16
Denmark					
Faroe Is.	250,000 – 250,000	95	(0)	(0–19)
