Food security is often misunderstood.
In the past, we were afraid of not having enough food. So the EU started supporting intensive agriculture.
But today, we produce far too much.

For real food security we need nature-friendly farming.

- **Intensive agriculture puts us at risk.**
  - It harms nature and destroys the ecosystems we need to produce food in the long term.

- **Burn food for energy!**
  - Even 60% of rapeseed production is used as biofuel.

- **Over production harms farmers by crashing prices.**
  - We eat so much meat and dairy it’s ruining our health.

- **88 million tons of food are wasted in the EU every year.**

We must transition to nature-friendly farming.

- Protecting our planet protects our ability to produce food into the future.

Reform the CAP.

The EU’s common agricultural policy must support its farmers for the sustainable transition of our continent.
